2

3 A computer program product including program code, when executed on a
4 computer, tracks the time spent by a user working with the computer for different
5 projects. The program code is arranged to provide a plurality of virtual desktops
6 which are assignable to different projects and switchable by the user; and to track the
7 time spent by the user working on the different desktops, thereby tracking the time
8 spent on the projects to which the respective desktops are assigned.
